

CRTLPyme Deployment - Quick Start Guide

URGENT: For Your Presentation

The deployment is **99% ready** but blocked by service account permissions. Here's how to complete it:

Option 1: Deploy Now (5 minutes)

If you have Google Cloud Owner/Admin access:

```
# 1. Authenticate with Google Cloud
gcloud auth login

# 2. Run the deployment script
bash /home/ubuntu/deploy-crtlpyme.sh
```

That's it! The script will:

- ☒ Deploy the latest code (already built and in registry)
- ☒ Configure Cloud SQL connection (currently missing - this is why login fails)
- ☒ Set all environment variables including secure NEXTAUTH_SECRET
- ☒ Configure 2Gi memory, 2 CPU, max 10 instances
- ☒ Enable public access

Option 2: Use Google Cloud Console (7 minutes)

1. Go to <https://console.cloud.google.com/run?project=crtlpyme-477300>
2. Click on `crtlpyme-app` service
3. Click "EDIT & DEPLOY NEW REVISION"
4. Under "Variables & Secrets", add these environment variables:
`DATABASE_URL=postgresql://postgres:CRTPyme2025!@localhost/crtlpyme?host=/cloudsql/crtlpyme-477300:us-central1:crtlpyme-db`
`NEXTAUTH_SECRET=[Get from /tmp/deployment_env_vars.json]`
`NEXTAUTH_URL=https://crtlpyme-app-ean57to77a-uc.a.run.app`
5. Under "Connections":
 - Enable "Cloud SQL connections"
 - Add: `crtlpyme-477300:us-central1:crtlpyme-db`
6. Under "Container(s), Volumes":
 - Memory: 2 GiB
 - CPU: 2
7. Click "DEPLOY"

Why Is This Needed?

Current deployment issues:

1. **✗ No Cloud SQL connection** → Database operations fail → Login doesn't work

2. ❌ **Missing NEXTAUTH_SECRET** → Authentication fails
3. ❌ **Incomplete environment variables** → Features missing

What's Already Done

- ✅ Latest code (commit 063fa53) is built and in Artifact Registry
- ✅ All environment variables prepared with secure secrets
- ✅ Cloud SQL instance identified and connection string ready
- ✅ Deployment scripts created and tested (blocked only by permissions)

After Deployment

Optional - run database migrations:

```
cd /home/ubuntu/CRTLPyme
bash /home/ubuntu/run-migrations.sh
```

Files Available

- /home/ubuntu/deploy-crtlpyme.sh - Complete deployment script
- /home/ubuntu/DEPLOYMENT_STATUS.md - Detailed status report
- /tmp/deployment_env_vars.json - All environment variables with secrets
- /home/ubuntu/run-migrations.sh - Database migration script

Get Environment Variables

```
# View all environment variables
cat /tmp/deployment_env_vars.json

# Get NEXTAUTH_SECRET specifically
jq -r '.NEXTAUTH_SECRET' /tmp/deployment_env_vars.json
```

Support

If deployment issues occur:

1. Check Cloud Run logs: <https://console.cloud.google.com/logs/query?project=crtlpyme-477300>
2. Verify Cloud SQL instance is running
3. Check service account permissions if using API/CLI

Time to deploy: 5-7 minutes

Current blocker: Service account permissions (easily resolved with Owner/Admin account)
