

CRTLPyme - Quick Start Deployment

Deploy in 5 Minutes via GCP Console

This is the **fastest** way to deploy CRTLPyme without installing anything locally.

Prerequisites Checklist

Before you start, ensure you have:

- [x] GCP account: crtlpyme@gmail.com
- [x] GCP project: crtlpyme-app
- [x] GitHub repository with latest code
- [x] Database running at 136.116.45.158:5432

Step 1: Configure Secrets (5 minutes)

1. Open Secret Manager

- Go to: <https://console.cloud.google.com/security/secret-manager?project=crtlpyme-app>
- Login with crtlpyme@gmail.com

2. Create Required Secrets

Click "CREATE SECRET" for each of these:

Secret Name	Value to Enter
DATABASE_URL	postgresql://postgres:CRTLPyme2025! @136.116.45.158:5432/crtlpyme
NEXTAUTH_SECRET	Generate at: https://generate-secret.vercel.app/32
SENDGRID_API_KEY	Your SendGrid API key (from SendGrid dashboard)
SENDGRID_FROM_EMAIL	noreply@crtlpyme.cl (or your verified sender)
transbank-api-key	Your Transbank API key
transbank-commerce-code	Your Transbank commerce code
TRANSBANK_ENVIRONMENT	production (or integration for testing)

For each secret:

- Name: [Use exact name from table above]
 - Secret value: [Paste the value]
 - Click "CREATE"
-

Step 2: Connect GitHub Repository (2 minutes)

1. Go to Cloud Build

- Visit: <https://console.cloud.google.com/cloud-build/triggers?project=crtlpyme-app>

2. Create Trigger

- Click "CREATE TRIGGER"
 - Name: `deploy-crtlpyme`
 - Event: Push to a branch
 - Source: Connect new repository
 - Select "GitHub (Cloud Build GitHub App)"
 - Authenticate and select your repository
 - Repository: `YOUR_USERNAME/CRTLPyME`
 - Branch: `^main$`
 - Configuration: Cloud Build configuration file (yaml or json)
 - Location: `/cloudbuild.yaml`
 - Click "CREATE"
-

Step 3: Deploy! (1 minute to trigger, 5-10 minutes to complete)

Option A: Deploy via Console (Easiest)

1. Trigger Manual Build

- Go to: <https://console.cloud.google.com/cloud-build/builds?project=crtlpyme-app>
- Click "RUN BUILD"
- Source: Repository
- Branch: main
- Configuration file location: `cloudbuild.yaml`
- Click "RUN BUILD"

2. Watch the Build

- Monitor progress in real-time
- Wait for green "SUCCESS" checkmark
- Takes 5-10 minutes

Option B: Deploy via Git Push

```
# Make any change or just trigger rebuild
cd /path/to/CRTLpyme
git commit --allow-empty -m "Trigger deployment"
git push origin main
```

The trigger will automatically start the build!

Step 4: Verify Deployment (1 minute)

1. Open Cloud Run

- Go to: <https://console.cloud.google.com/run?project=crtlpyme-app>
- Find service: `crtlpyme`
- Click on the service

2. Get the URL

- Copy the service URL (something like: `https://crtlpyme-xxxxx.run.app`)
- Click to open

3. Test the Application

- Homepage should load
 - Try logging in
 - Check that database connection works
-

Troubleshooting

Build Failed?

1. Check Build Logs

- Click on the failed build
- Look for red error messages
- Common issues:
 - Missing secrets → Go back to Step 1
 - Docker build error → Check Dockerfile syntax
 - Database connection → Verify DATABASE_URL secret

2. Fix and Retry

- Fix the issue
- Click "REBUILD" button in Cloud Build

Application Won't Load?

1. Check Cloud Run Logs

- Go to Cloud Run → `crtlpyme` service
- Click "LOGS" tab
- Look for startup errors

2. Common Issues:

- Database connection error → Verify DATABASE_URL
- Missing secrets → Check Secret Manager
- Port mismatch → Should be port 3000

Database Connection Error?

1. Verify Database is Running

```
bash
# Test from your machine
psql -h 136.116.45.158 -U postgres -d crtlpyme
# Password: CRTLPyme2025!
```

2. Check DATABASE_URL Secret

- Go to Secret Manager
- Verify the DATABASE_URL is correct
- Format: `postgresql://postgres:CRTLPyme2025!@136.116.45.158:5432/crtlpyme`

Next Steps

Enable Automated Deployments

Use GitHub Actions for automatic deployment on every push:

1. Run Setup Script in Cloud Shell

```
```bash
Open Cloud Shell: https://shell.cloud.google.com

Clone repository (if not already)
git clone https://github.com/YOUR_USERNAME/CRTLPyme.git
cd CRTLPyme

Run setup script
./scripts/setup-github-actions-sa.sh
```
```

1. Copy the Key to GitHub

- Follow instructions from the script
- Add to: `https://github.com/YOUR_USERNAME/CRTLPyme/settings/secrets/actions`

2. Done!

- Now every push to `main` branch will auto-deploy
- View deployments in GitHub Actions tab

Monitoring

View Logs

- **Cloud Run Logs:** `https://console.cloud.google.com/run/detail/us-central1/crtlpyme/logs`
- **Build Logs:** `https://console.cloud.google.com/cloud-build/builds`

View Metrics

- **Performance:** <https://console.cloud.google.com/run/detail/us-central1/crtlpyme/metrics>
- Monitor: CPU, Memory, Request count, Response times

Set Up Alerts

1. Go to: <https://console.cloud.google.com/monitoring/alerting>
2. Create alerts for:
 - High error rate
 - High latency
 - Container crashes

Important URLs

| Resource | URL |
|----------------|---|
| Application | https://crtlpyme-app-399088129827.us-central1.run.app |
| GCP Console | https://console.cloud.google.com/?project=crtlpyme-app |
| Cloud Run | https://console.cloud.google.com/run?project=crtlpyme-app |
| Cloud Build | https://console.cloud.google.com/cloud-build/builds?project=crtlpyme-app |
| Secret Manager | https://console.cloud.google.com/security/secret-manager?project=crtlpyme-app |
| Logs | https://console.cloud.google.com/logs?project=crtlpyme-app |

Support

Questions? Check the full [DEPLOYMENT_GUIDE.md](#) (./DEPLOYMENT_GUIDE.md) for detailed documentation.

Issues?

1. Check build and application logs
 2. Verify all secrets are configured
 3. Test database connectivity
 4. Review cloudbuild.yaml configuration
